A thought on AI and experience

Everyone has the same AI now.

So why do some people get far better results from it?

The answer isn't a better tool.

Swipe →

The tool is no longer your advantage.

900M+

people use ChatGPT every week

OpenAI, Feb 2026

1 in 5

working-age adults worldwide now use AI

Microsoft, June 2026 (18.8%)

Not everyone has AI yet. But almost everyone **you compete with** does — your peers, your juniors, even your clients.

Same question in.
Similar answer out.

Researchers asked **70+ AI models** open-ended questions. Different models gave strikingly similar answers.

“Artificial Hivemind” study, NeurIPS 2025

Stories written with AI ideas were **more alike** than stories people wrote on their own.

Doshi & Hauser, Science Advances, 2024

Why? Most AI models learn from overlapping internet data and are tuned in similar ways. Not word-for-word the same, but the same kind of “safe” answer.

Generic question → generic result.

AI raised the floor for everyone.

Harvard and BCG gave 758 consultants GPT-4. On tasks AI is good at, they produced:

40%
higher quality

25%
faster work

12%
more tasks done

The biggest jump went to weaker performers: **+43%**, vs **+17%** for top performers.

“Good enough” is now available to everyone. Good enough is the new average.

But AI has a jagged edge.

19 percentage points **less likely** to get the right answer: consultants who used AI on a task it couldn’t handle.

AI sounds just as confident when it’s wrong.

And there’s no label telling you which task is which.

Knowing where that edge is? That’s experience.

What your experience adds that AI can’t.

01

Context

You know the client, the budget and the history. AI doesn’t, unless you tell it.

02

The right question

Years of work teach you what to ask. A better question beats a better tool.

03

Judgment

You can spot the wrong answer that sounds right, before it reaches your client.

04

Taste

You know what “good” looks like in your field, so you don’t stop at the first draft.

AI gives answers. You bring the thinking.

Swipe →

5 ways to get output nobody else gets.

1 **Give context, not just a command**

Who it’s for, the goal, the limits, what failed before.

2 **Feed it your own examples**

Your past work and your voice, so it doesn’t sound like everyone.

3 **Ask for 10 options, skip the obvious**

The first answer is the one everyone else gets.

4 **Make it criticise its own answer**

“What’s weak or wrong here?” Then fix it.

5 **Fact-check, then edit with your judgment**

Never copy-paste. The final call is always yours.

Save this for your next prompt.

Swipe →

Same tool. Two prompts.

BEGINNER

“Write a headline for a skincare brand.”

You get the same “glow” and “natural beauty” lines every other brand already uses.

EXPERIENCED

“Write 10 headlines for a handmade skincare brand from Jaipur. Audience: working women, 25–35. Tone: warm and rooted, not salesy. Don’t use ‘glow’, ‘radiant’ or ‘flawless’. Then pick the best 2 and tell me why.”

You get options that sound like this brand, plus reasons you can judge.

The difference isn’t the AI. It’s what you knew to ask.

Try it on your next task.

Swipe →

AI is the same for everyone.
You are not.

AI raised the floor. Your years of experience raise the ceiling. They're the one input nobody else can copy.

How do you make AI work your way?
